

Date:

## Wednesday Challenge Form

Group Members: Jaden, Christian, Aren, Carlos

### Problem Statement:

We had to find a way to determine whether an animal was either a dog or cat without touching it.

### Approach:

A lot of people in our team had ideas but we had all come to one solution. And it was to put the animal in a cat scan or put the animal in an x-ray and that way we would be able to detect the bone structure between the two animals. It was funny to find out that some other groups had come up with ideas kind of like ours.

### Solution:

Take a scan or x-ray of the animal the the photo will be seen through a computer and then we will be able to see and analyze the body and bone structure.

### Lessons Learned:

If I were to do a challenge like this again, I would reseach more info about dogs and cats so that we can locate more differences and then be able to have more ideas
